June 2010, Freiberg

§ 1. Introduction

The Cauchy problem of 2nd order hyperbolic equation:

$$(C) \begin{cases} (\partial_t^2 + 2b\partial_t\partial_x - a^2\partial_x^2) u = 0, & (t, x) \in \mathbb{R}_+ \times \mathbb{R}, \\ (u(0, x), \partial_t u(0, x)) = (u_0(x), u_1(x)) & x \in \mathbb{R}, \\ a = a(t), b = b(t), a^2 + b^2 > 0. \end{cases}$$

Total energy of the solution of (C):

$$E(t) := \|\partial u(t, \cdot)\|_{L^2(\mathbb{R}_x)}^2 + \|\partial_t u(t, \cdot)\|_{L^2(\mathbb{R}_x)}^2$$

“Generalized Energy Conservation (=GEC)” as $t \rightarrow \infty$:

$$C^{-1}E(0) \leq E(t) \leq CE(0) \Leftrightarrow E(t) \simeq E(0).$$

Basic properties

$$E_0(t) := a(t)^2 \|\partial u(t, \cdot)\|^2 + \|\partial_t u(t, \cdot)\|^2 \simeq E(t),$$

$$a \in C^1([0, \infty)), \quad 0 < a_0 \leq a(t) \leq a_1.$$

$$E'_0(t) = 2a'(t)a(t)\|\partial u(t, \cdot)\|^2 - 4b(t) (\partial \partial_t u(t, \cdot), \partial_t u(t, \cdot))$$

$$\stackrel{\leq}{\geq} \pm 2a_0^{-1} |a'(t)| E_0(t)$$

$$\Rightarrow E_0(t) \stackrel{\leq}{\geq} \exp\left(\pm 2a_0^{-1} \int_0^t |a'(s)| ds\right) E_0(0)$$

- (i) $b(t)$ has no influence for the estimate of $E_0(t)$;
- (ii) No “energy conservation” if $a'(t) \not\equiv 0$;
- (iii) $a' \in L^1(\mathbb{R}_+) \Rightarrow E_0(t) \simeq E_0(0)$ (= (GEC));
- (iv) (GEC) is not trivial if $a' \notin L^1(\mathbb{R}_+)$.

§ 2. Previous results

Conditions to the coefficients

$$0 < c_0 \leq \sqrt{a(t)^2 + b(t)^2} =: c(t) \leq c_1,$$

$$\begin{cases} |a^{(k)}(t)| \lesssim (1+t)^{-k\beta_a} \\ |b^{(k)}(t)| \lesssim (1+t)^{-k\beta_b} \end{cases} \quad (k = 1, \dots, m)$$

$$\int_0^t (|a(s) - a_\infty| + |b(s) - b_\infty|) ds \lesssim (1+t)^\alpha$$

($\exists a_\infty, \exists b_\infty, \alpha \in [0, 1)$)

- (i) (GEC) is trivial if $\beta_a > 1$;
- (ii) $\alpha = 1$ gives a trivial condition.

$$\underline{b = 0}$$

$$a(t) \in C^m, |a^{(k)}| \lesssim t^{-k\beta_a}, \int_0^t |a - a_\infty| ds \lesssim t^\alpha$$

$$m = 1, \beta_a > 1 \Rightarrow \text{(GEC)} \text{ (trivial case)}$$

$$m = 2, \beta_a = 1 \Rightarrow \text{(GEC)} \text{ (Yamazaki ('89), Reissig-Smith ('05))}$$

$$m = \infty, \beta_a < 1 \Rightarrow \text{not (GEC)} \text{ (Reissig-Smith ('05))}$$

$$m \geq 2, \alpha < 1, \beta_a \geq \alpha + \frac{1-\alpha}{m} (< 1) \Rightarrow \text{(GEC)} \text{ (H. ('07))}$$

$$m = \infty, \beta_a < \alpha < 1 \Rightarrow \text{non (GEC)} \text{ (H. ('07))}$$

$$a \in \gamma^{(s)} \text{ (Gevrey class)}, \beta_a \rightarrow \alpha + 0 \text{ (H. ('10))}$$

$$\underline{b(t) \neq 0}$$

$$a(t), b(t) \in C^m, |a^{(k)}| \lesssim t^{-k\beta_a}, |b^{(k)}| \lesssim t^{-k\beta_b},$$
$$\int_0^t (|a - a_\infty| + |b - b_\infty|) ds \lesssim t^\alpha$$

$m = 1, \beta_a > 1 \Rightarrow$ (GEC) (trivial case)

$m = 2, \beta_a = 1, \beta_b > 1 \Rightarrow$ (GEC) (cf. Reissig-H. ('05))

$m = 2, \beta_a = \beta_b = 1 \Rightarrow$ *non* (GEC) (cf. Reissig-H. ('04))

$m = 2, \beta_a = \beta_b = 1$, “Levi’s condition” (L1):

$$(L1) \left| \int_0^t \frac{b'(s)}{c(s)} ds \right| \leq C \Rightarrow \text{(GEC)}$$

(cf. Reissig-H. ('05), D’Abbicco-Lucente-Tagliatela ('09))

Summary of the previous results

$$(\partial_t^2 + 2b\partial_t\partial_x - a^2\partial_x^2)u = 0, \quad c = \sqrt{a^2 + b^2},$$

$$|a^{(k)}| \lesssim t^{-k\beta_a}, \quad |b^{(k)}| \lesssim t^{-k\beta_b}, \quad \left| \int_0^t \frac{b'(s)}{c(s)} ds \right| \leq C$$

$$\int_0^t (|a - a_\infty| + |b - b_\infty|) ds \lesssim t^\alpha. \quad (L1)$$

	$b = 0$	$b \neq 0$
$m = 1$	$\beta_a > 1$	
$m = 2$	$\beta_a = 1$	$\beta_a = \beta_b = 1, (L1)$ $(\beta_a = \beta_b = 1, \text{non } (L1))$
$m \geq 2$	$\beta_a \geq \alpha + \frac{1-\alpha}{m}$ $(\beta_a < \alpha)$???

Examples

$$\underline{\int_0^t |a(s) - a_\infty| ds \lesssim t^\alpha}$$

$$\chi(\tau) \in C^m([0, 1]), \chi(0) = \chi(1) = 1, \chi(\tau) \geq 0,$$

$$I_j = [t_j, t_j + t_j^\alpha], t_j = 2^j,$$

$$a(t) = \begin{cases} \chi(t_j^{-\alpha}(t - t_j)) & (t \in I_j, j = 1, 2, \dots) \\ 1 & (t \notin \bigcup_j I_j) \end{cases}$$

$$\underline{\left| \int_0^t \frac{b'(s)}{c(s)} ds \right| \leq C}$$

$$a(t) = b(t) \Rightarrow \left| \int_0^t \frac{b'(s)}{c(s)} ds \right| = \frac{1}{\sqrt{2}} \left| \int_0^t \frac{a'(s)}{a(s)} ds \right|$$

Why do we call (L1) “Levi’s condition”?

$$(\partial_t^2 + 2b\partial_t\partial_x - a^2\partial_x^2)u = 0$$

$$\Downarrow v(t; \xi) = \hat{u}(t, \xi)$$

$$v'' + 2ib\xi v' + a^2\xi^2 v = 0$$

$$\Downarrow w(t; \xi) = \exp\left(-i\xi \int_\tau^t b(s) ds\right) v(t; \xi)$$

$$w'' + c^2\xi^2 w - i\xi b' w = 0, \quad c = \sqrt{a^2 + b^2}$$

$$\underline{c(t) = t^l, \quad b'(t) = t^k}$$

$$\left| \int_t^\infty \frac{b'(s)}{c(s)} ds \right| \leq C \Leftrightarrow k > l - 1$$

§ 3. Main theorem

$$(\partial_t^2 + 2b(t)\partial_t\partial_x - a(t)^2\partial_x^2) u = 0$$

$$|a^{(k)}(t)| + |b^{(k)}(t)| \lesssim t^{-k\beta} \quad (k = 1, \dots, m)$$

$$\int_0^t (|a(s) - a_\infty| + |b(s) - b_\infty|) ds \lesssim t^\alpha$$

$$c = \sqrt{a^2 + b^2}, \quad \left| \int_0^t \frac{b'(s)}{c(s)} ds \right| \leq C \dots (\text{L1})$$

Theorem 1

$$m = 2, \beta \geq \frac{\alpha+1}{2} (= \alpha + \frac{1-\alpha}{2}), (\text{L1}) \Rightarrow (\text{GEC}).$$

$$m = 3, \beta \geq \frac{2\alpha+1}{3} (= \alpha + \frac{1-\alpha}{3}), (\text{L1}) \Rightarrow (\text{GEC}).$$

Conditions for (GEC)

	$b = 0$	$b \neq 0$
$m = 1$	$\beta_a > 1$	
$m = 2$	$\beta_a = 1$	$\beta_a = \beta_b = 1, (L1)$ $(\beta_a = \beta_b = 1, \text{non } (L1))$
	$\beta_a \geq \alpha + \frac{1-\alpha}{2}$	$\beta \geq \alpha + \frac{1-\alpha}{2}, (L1)$
$m = 3$	$\beta_a \geq \alpha + \frac{1-\alpha}{3}$	$\beta \geq \alpha + \frac{1-\alpha}{3}, (L1)$
$m \geq 4$	$\beta_a \geq \alpha + \frac{1-\alpha}{m}$ $(\beta_a < \alpha)$???

$$(\partial_t^2 + 2b(t)\partial_t\partial_x - a(t)^2\partial_x^2) u = 0$$

$$|a^{(k)}(t)| + |b^{(k)}(t)| \lesssim t^{-k\beta} \quad (k = 1, \dots, m)$$

$$\int_0^t (|a(s) - a_\infty| + |b(s) - b_\infty|) ds \lesssim t^\alpha$$

$$c = \sqrt{a^2 + b^2}, \quad \left| \int_0^t \frac{b'(s)}{c(s)} ds \right| \leq C \dots \text{(L1)}$$

$$\left| \int_t^\infty \frac{c(b'c'' - b''c') + b'((c')^2 - (b')^2)}{c^5} ds \right| \leq t^{-2\alpha} \quad \text{(L2)}$$

Theorem 2

$$m = 4, 5, \quad \beta \geq \alpha + \frac{1-\alpha}{m}, \quad \text{(L1), (L2)} \Rightarrow \text{(GEC)}.$$

Conditions for (GEC)

	$b = 0$	$b \neq 0$
$m = 1$	$\beta_a > 1$	
$m = 2$	$\beta_a = 1$	$\beta_a = \beta_b = 1, (L1)$ $(\beta_a = \beta_b = 1, \text{non } (L1))$
$m = 2, 3$	<div style="border: 1px solid black; height: 40px; width: 100%;"></div>	
$m = 4, 5$	$\beta_a \geq \alpha + \frac{1-\alpha}{m}$	$\beta \geq \alpha + \frac{1-\alpha}{m}, (L1), (L2)$
$m \geq 6$	$(\beta_a < \alpha)$???

Remarks

$$|a^{(k)}(t)| + |b^{(k)}(t)| \lesssim t^{-k\beta} \quad (k = 1, \dots, m)$$

I. (L1) is not trivial for $\beta = \alpha + \frac{1-\alpha}{m} (< 1)$, $m \geq 2$.

$$\left| \int_0^t \frac{b'(s)}{c(s)} ds \right| \leq \int_0^t \frac{|b'(s)|}{c_0} ds \lesssim \int_0^t (1+s)^{-\beta} ds \rightarrow \infty$$

II. (L2) is not trivial for $\beta = \alpha + \frac{1-\alpha}{m} (< \frac{2\alpha+1}{3})$, $m \geq 4$.

$$\left| \int_t^\infty \frac{c(b'c'' - b''c') + b'((c')^2 - (b')^2)}{c^5} ds \right|$$
$$\lesssim \int_0^t (1+s)^{-3\beta} ds \lesssim t^{1-3\beta} \quad (\lesssim t^{-2\alpha} \text{ is not true})$$

§ 4. Sketch of the proof

Our goal: prove the estimate

$$\mathcal{E}(t; \xi) = |v'(t; \xi)|^2 + \xi^2 |v(t; \xi)|^2 \simeq \mathcal{E}(0; \xi)$$

$$v'' + 2ib\xi v' + a^2 \xi^2 v = 0$$

In low frequency part

We easily have the estimate $\mathcal{E}(t; \xi) \simeq \mathcal{E}(0; \xi)$ in Z_Ψ :

$$Z_\Psi = \{(t, \xi) ; 0 \leq t < t_\xi\}, (1 + t_\xi)^\alpha |\xi| = N$$

by

$$\int_0^t (|a(s) - a_\infty| + |b(s) - b_\infty|) ds \lesssim t^\alpha.$$

In high frequency part

$$Z_H = \{(t, \xi) ; t \geq t_\xi\}, (1 + t_\xi)^\alpha |\xi| = N$$

Keywords:

symbol class, diagonalization, real parts of diagonal entries

$$f(t, \xi) \in S\{p, q\} \Leftrightarrow |\partial_t^k f(t, \xi)| \lesssim |\xi|^p (1 + t)^{-\beta(k+q)}$$

$$S\{p, q\} \supset S\{p - 1, q + 1\}$$

$$f(t, \xi) \in S\{-(m - 1), m\}$$

$$\Rightarrow \int_{t_\xi}^t |f(s, \xi)| ds \lesssim C \text{ for } \beta \geq \alpha + \frac{1-\alpha}{m}$$

$$w'' + a^2 \xi^2 w - ib' \xi w = 0, \quad w(t; \xi) = e^{-i\xi \int_{\tau}^t b(s) ds} v(t; \xi)$$

$$\left(\frac{d}{dt} - \Phi_1 - R_1\right) W_1 = 0, \quad W_1 = {}^t(w' + i\xi c w, w' - i\xi c w)$$

$$\Phi_1 = \begin{pmatrix} \phi_{1+} & 0 \\ 0 & \phi_{1-} \end{pmatrix}, \quad \phi_{1\pm} = \pm i\xi c - \frac{c'}{2c} \mp \frac{b'}{2c}$$

$$R_1 = \begin{pmatrix} 0 & r_{1+} \\ r_{1-} & 0 \end{pmatrix}, \quad r_{1\pm} = -\frac{c'}{2c} \mp \frac{b'}{2c} \in S\{0, 1\}$$

$$|W_1(t; \xi)|^2 \simeq \mathcal{E}(t; \xi)$$

$$\lesssim \mathcal{E}(t_\xi; \xi) \exp \left(C \left(\left| \int_{t_\xi}^t \Re\{\phi_{1\pm}\} ds \right| + \int_{t_\xi}^t |r_{1\pm}| ds \right) \right)$$

Without (L1)

$$\left(\frac{d}{dt} - \Phi_1 - R_1\right) W_1 = 0, \quad R_1 \in S\{0, 1\}$$

$$a, b \in C^2 \Downarrow \exists M_1 \text{ in } Z_H, \quad W_2 = M_1 W_1,$$

$$\left(\frac{d}{dt} - \Phi_2 - R_2\right) W_2 = 0,$$

$$R_2 \in S\{0, 1\} \quad (R_2 \in S\{-1, 2\} \text{ for } b \equiv 0)$$

$$a, b \in C^3 \Downarrow \exists M_2 \text{ in } Z_H, \quad W_3 = M_2 W_2,$$

$$\left(\frac{d}{dt} - \Phi_3 - R_3\right) W_3 = 0,$$

$$R_3 \in S\{0, 1\} \quad (R_3 \in S\{-2, 3\} \text{ for } b \equiv 0)$$

With [\(L1\)](#)

$$\left(\frac{d}{dt} - \Phi_1 - R_1\right) W_1 = 0, \quad R_1 \in S\{0, 1\}$$

$$a, b \in C^2 \Downarrow \exists M_1 \text{ in } Z_H, \quad W_2 = M_1 W_1,$$

$$\left(\frac{d}{dt} - \Phi_2 - R_2\right) W_2 = 0,$$
$$R_2 \in S\{-1, 2\}, \quad \left| \exp\left(\int_{t_\xi}^t \phi_{2\pm}(s, \xi)\right) ds \right| \leq C$$

$$a, b \in C^3 \Downarrow \exists M_2 \text{ in } Z_H, \quad W_3 = M_2 W_2,$$

$$\left(\frac{d}{dt} - \Phi_3 - R_3\right) W_3 = 0,$$
$$R_3 \in S\{-2, 3\}, \quad \left| \exp\left(\int_{t_\xi}^t \phi_{3\pm}(s, \xi)\right) ds \right| \leq C$$

$$|W_1(t; \xi)|^2 \simeq |W_2(t; \xi)|^2 \simeq |W_3(t; \xi)|^2 \simeq \mathcal{E}(t; \xi)$$

With (L1) and (L2)

$$\left(\frac{d}{dt} - \Phi_3 - R_3\right) W_3 = 0, \quad R_3 \in S\{-2, 3\}$$

$$a, b \in C^4 \Downarrow \exists M_3 \text{ in } Z_H, \quad W_4 = M_3 W_3,$$

$$\left(\frac{d}{dt} - \Phi_4 - R_4\right) W_4 = 0,$$

$$R_4 \in S\{-3, 4\}, \quad \left| \exp \left(\int_{t_\xi}^t \phi_{4\pm}(s, \xi) \right) ds \right| \leq C$$

$$a, b \in C^5 \Downarrow \exists M_4 \text{ in } Z_H, \quad W_5 = M_4 W_4,$$

$$\left(\frac{d}{dt} - \Phi_5 - R_5\right) W_5 = 0,$$

$$R_5 \in S\{-4, 5\}, \quad \left| \exp \left(\int_{t_\xi}^t \phi_{5\pm}(s, \xi) \right) ds \right| \leq C$$

$$|W_4(t; \xi)|^2 \simeq |W_5(t; \xi)|^2 \simeq \mathcal{E}(t; \xi)$$

Thank you very much for your attention!

ご静聴ありがとうございました。
